The diagram illustrates a GATE DRIVER INTERFACE circuit. It consists of a 74VHC161 4-bit counter and a 74VHC07 inverter. The counter's Q0, Q1, Q2, and Q3 outputs are connected to the inputs of the inverter, which then drives the GATE_A, GATE_B, GATE_C, and GATE_D outputs. The counter is clocked by a 10kHz signal and has its Q4 output connected to a 10k pull-up resistor. The inverter's output is also connected to a 10k pull-up resistor.

Going to take a guess that VN17 diode is a 600V 1A fast recovery. Going with : MURA160T3G as is an onsemi part.
An STH112A is used on the STGAP eval board.
2H2 on the same eval board is a STPS3L40-Y
3A 40V schottky. Will try a SS34.
No info on G1 so trying a B5819WS.
No info on JV so trying a B5819WS.
No info on the depletion mode N MOS so trying a BSS169.

The top diagram shows a 12V input connected to the sensor's VIN pin. A 1k resistor and a 100nF capacitor are connected to the VDD pin. The sensor's output pins are connected to a 5V supply.

The bottom diagram shows a 12V input connected to the sensor's VIN pin. A 1k resistor and a 100nF capacitor are connected to the VDD pin. The sensor's output pins are connected to a 5V supply.
